ABSTRACT

The present disclosure relates to a browser-controlled faxing system and method. In one arrangement, the system and method involve receiving a fax request from a user browser, uploading content to the user browser, receiving a fax job from

5   the user browser, and transmitting a facsimile to a recipient device. In one arrangement, the system and method can be implemented with a faxing device that comprises a processing device, faxing hardware, a networking device, and memory comprising a fax control module and an embedded server, the fax control module including logic for generating at least one control screen that can be uploaded to a user

10   browser and at least one application that can also be uploaded to the user browser, the at least one application further being configured to perform a designated task on a computing device on which the user browser runs.
